Assignment

Inventory Monitoring System

You have to build an inventory monitoring system for e-commerce websites. An email will be triggered to the admin user three time in a day(like 10:00 AM, 01:00 PM, 5:00 PM) with the subject line `${product_id} inventory is low. please update it`

Functional Requirement

- Create an api to add products in inventory. product fields are
  - product name
  - product image(s)
  - product category(dropdown)
  - Stock count(int)
- API to register an email who want to receive the update if the inventory of any product is less than 5

Please send me github repository and instruction to run the program

Notes
- Please use laravel or codeigniter only.
- There is will additional point, if you make UI for these functionality instead of API only
